BUSINESS SOFTWARE

pegasus OPERA II

Today it is more apparent than ever that business processes must continually evolve and integrate with each other, or fall by the roadside. To keep pace with the rapid changes in the way that business is carried out — and to take full advantage of all the opportunities — companies are becoming increasingly reliant on 32-bit Windows and Microsoft-based applications, networking, E-mail and the Internet. Any system not exploiting these technologies will be quickly surpassed.

Pegasus Opera II, the 32-bit business and accounting solution from Pegasus Software Limited, not only provides companies with the technology required to remain competitive in today's markets, but also allows them to actively leverage information for real business benefit in order to lead the way in the future.

Pegasus Opera II is a business and accounting system based on Microsoft technology. It can support many clients and has the power to provide critical management information as and when required. Because Pegasus Opera II is a re-development of Pegasus Opera, one of the UK's most successful accounting products, you can be confident that you will be using a powerful and robust solution.

Adaptable to changing business processes

Pegasus has become a leading supplier of business and accounting solutions because it has developed products that can adapt to the changing demands of its customers' businesses. Pegasus Opera II is a modular solution, so you can select the components that match your current business model, and as these requirements change you can then add additional functionality. This

means that you can expand the capability or capacity of your system while safeguarding your existing investment. This is a seamless operation with minimal disruption to your day-to-day processes.

Pegasus Opera II can add that vital edge to your overall business, allowing you to take early advantage from it, safe in the knowledge that it will grow with you.

Analyse business facts and predict trends

It is important that you can quickly analyse business facts and see developing trends in your company. Such information can enable you to make timely decisions that can have a direct influence on your profitability. Extensive and definable reporting facilities within Opera II allow you to produce reports which you can act upon. Reports can be concise, to give you a snapshot view, or can be as detailed as you want them to be. Alternatively you can set up your own definable Business Alerts and monitor these on a periodic basis. When a business rule is broken or certain criteria met, a user-definable message or task request can be routed via E-mail or fax using Microsoft Outlook or Microsoft Exchange Server to one or many recipients. For example, an automatic E-mail could be sent to the Credit Controller on a daily basis listing all overdue accounts.

Harnessing today's technology

The open architecture of Opera II fully exploits today's technology allowing more information to be processed simultaneously, multi tasking to be deployed and greater utilisation of hardware and operating systems. It also provides greater resilience against hardware or network failure since Opera II deploys Transaction Processing. The transaction postings in Opera II are arranged so that all related updates are committed at once. If the posting fails for any reason prior to the relevant tables being updated,

Opera II will roll back to the position prior to the failure. E-mail, Web-based reporting via Crystal Reports and the Internet are fully enabled in Opera II. Any special requirements to suit the way your business functions can be tailored by our authorised Resellers.

Microsoft look and feel

Like all Pegasus products, Pegasus Opera II has been designed to be easy to use. Navigation around Opera II could not be easier. Users can elect to use drop down menus or a tree view similar to Microsoft Explorer, or both. The forms in Opera II have been designed with clarity in mind, and security and system preferences can also be configured for each user.

eBusiness — Electronic trading made easy

Many businesses have realised the opportunities for increased sales and reduced overheads that trading over the Internet offers. However, business-to-business relationships are not always catered for in many eCommerce solutions available today.

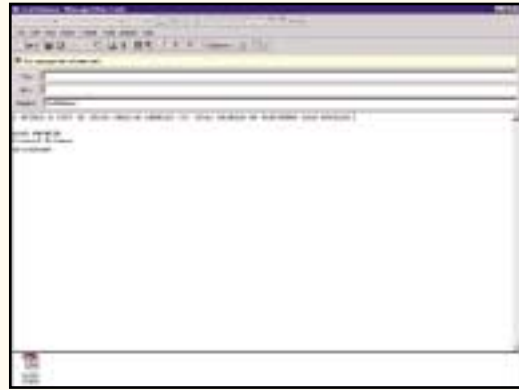

The eCommerce Gateway provides the ability to trade cost online with other businesses whilst increasing operating-efficiency. Order information is imported into Opera II without re-keying data and therefore avoiding human error. Your customers are also able to view their own pricing, selected account information, order status and account history information under your control through Opera II and the eCommerce Gateway.

The eCommerce Gateway gives you the ability to seamlessly integrate your eCommerce solution with Opera II and really start taking advantage of the Internet.

An impressive breadth of functionality

Multi-company, Multi-currency, Multi-warehouses — Opera II provides all the functionality a progressive business requires. This includes comprehensive Security facilities, VAT100 reporting, Nominal Consolidation, EMU - Triangulation, Drill Down, Rapid Searching and definable Management Reports. The solution is also fully E-mail and Internet enabled, provides Web-based Reporting via Crystal Reports, Discount Matrix, Price Lists and definable Business Alerts and Profiles. In addition, the Pegasus Opera II Toolkit enables authorised developers to fulfil any special requirements you may have, thanks to the open system that is one of the design principles of Opera II.

To summarise, Pegasus Opera II is a compelling product based on a tried and tested foundation. Deploying the latest technologies it addresses the real issues faced by any finance department and will help you manage your organisation in today's competitive market.
